

Legal Ditch Systems

SOLUTIONS & SERVICES

Agricultural drainage is vital for producers in this region. Local drainage authorities are tasked with the important role of constructing, maintaining, and repairing the legal ditch systems that form the cornerstone for effective drainage.

Since 1960, Moore has developed many significant water resource projects. Many of those projects have included assisting clients in managing hundreds of miles of legal ditch systems. We have experienced field staff that regularly inspect these facilities, identify maintenance needs, and coordinate the necessary repairs.

Our engineers have extensive experience with reconstructing existing legal ditch systems, determining as-built and subsequently improved conditions (ACSIC) to establish the ditch's original grade and developing laterals or entirely new facilities; including assistance in acquiring necessary right-of-way, permits, and facilitating utility relocations.

CAPABILITIES

- Project Development
- Hydraulic Modeling
- Assessment District Development
- Field Studies
- Wetland Delineation
- Grant Applications
- Permitting
- Right of Way Acquisition
- Design Services
- Drone Services
- Construction Administration
